The GWAS is an experimental design used to detect associations between genetic variants and traits in samples from populations. The primary goal of these studies is to better understand the biology of disease, under the assumption that a better understanding will lead to prevention or better treatment.

10 Years of GWAS Discovery: Biology, Function, and

We report a case of reactive arthritis following tetanus vaccination. A healthy 55-year-old woman presented with pain and acute swelling of the right knee two days after receiving a tetanus vaccination. Erythrocyte sedimentation rate and C-reactive

Reactive arthritis following tetanus vaccination: a case

This is a list of therapeutic, diagnostic and preventive monoclonal antibodies, antibodies that are clones of a single parent cell. When used as drugs, the International Nonproprietary Names (INNs) end in -mab.

List of therapeutic monoclonal antibodies - Wikipedia

Notes: In the first few months after the start of immunotherapy, some patients may experience an immunological reaction in the form of nodal enlargement or inflammation.
