Climate change analysis requires datasets that not only cover a long span of time, but are also homogeneous through time. A homogeneous climate record is one in which all observed climate variations are due to the behaviour of the atmosphere, not other influences, such as changes in location

The Australian Climate Observations Reference Network – Surface Air Temperature (ACORN-SAT) dataset has been developed to monitor climate variability and change in Australia. The dataset employs the latest analysis techniques and takes advantage of digitised observational data to provide a daily

Temperature is a physical quantity expressing hot and cold. It is measured with a thermometer calibrated in one or more temperature scales. The most commonly used scales are the Celsius scale (formerly called centigrade) (denoted °C), Fahrenheit scale (denoted °F), and Kelvin scale (denoted K).

The instrumental temperature record provides the temperature of Earth's climate system from the historical network of in situ measurements of surface air temperatures and ocean surface temperatures.

The “pause” in global warming is becoming increasingly difficult for the climate establishment to ignore, which is a good thing. They are now coming up with reasons why there has been a “pause” (a term I dislike because it implies knowledge of future warming, which no one has), and spinning it as if it is bad news for us.

Topography When moving encounters a hill or mountain, it is forced to rise. Because rising air cools and condenses, precipitation is heaviest on the upwind side of a mountain, where the air is rising.
